

ANOTO START PACKAGES

PRODUCT DESCRIPTION

To enable Anoto customers to get started quickly in developing and launching services based on Anoto functionality Anoto has packaged two start packages tailored for different target groups.

The start packages include the tools used to design the paper product enabled by Anoto functionality and to generate the postscript file which is the input file in the printing process. The start packages also include development tools used to develop applications running on either a PC platform or server platform in a network. More information about the design and development tools are provided in the specific product data sheets available for the tools.

Start Package for Commercial Use

This package is targeted to customers who want to launch commercial services based on Anoto functionality – that is, end-user companies and software product companies. To be able to get the required pattern license(s) and launch services, the Service Provider Agreement must be signed.

Start Package for Non-Commercial Use

This package is for universities wanting to experiment with Anoto functionality and neither develop nor launch any commercial services.
